Atlas of Gallium-67 Scintigraphy: A New Method of Radionuclide Medical Diagnosis

Gerald Johnston

Atlas of Gallium-67 Scintigraphy: A New Method of Radionuclide Medical Diagnosis Gerald Johnston
In 1970, under the sponsorship of Oak Ridge Associated Universities (ORAU), a group of clinical investigators formed the Cooperative Group to Study Localization of Radiopharmaceuticals. The first radiopharmaceutical selected for study was ⁶⁷Gallium (⁶⁷Ga) administered as the citrate. The object of the study was to determine the usefulness of ⁶⁷Ga in the diagnosis and treatment of patients with various malignancies. Funding for the project was granted by the U. S. Atomic Energy Commission and the National Cancer Institute, National Institutes of Health (NIH). The Nuclear Medicine Department of the Clinical Center, NIH, agreed to assist ORAU with aspects of this study, particularly with ⁶⁷Ga scintigraphy of patients with lymphoma and Hodgkin's disease. Preliminary reports from the ORAU study are in press. Since April 1971, ⁶⁷Ga scintigraphy has gained increasing use in the study of cancer patients at the Clinical Center, NIH, where well over 1000 such patients have been examined by this method. This monograph was written to present selected examples from this group of a variety of malignancies seen in this 28-month period. No attempt has been made to correlate this overall experience statistically. Rather, this presentation is to help familiarize the practitioner of Nuclear Medicine with the wide range of usefulness for ⁶⁷Ga scintigraphy while making him aware of the variation in scan appearance and watchful of the many pitfalls of ⁶⁷Ga scan interpretation. Permission to use these patient studies and x-rays was generously granted by Dr. Paul P.
